I'm implementing a "stack" in C (only for my own amusement, but that's not a problem). I know there's `std::queue`, which implements a FIFO queue. What I'm looking for is something that, instead of queueing up things, stacks them up. You pop them off, and they're added back on top of it. I see that `std::vector` can be used to achieve something like this. Are there any other classes that are efficient for this? Are there any known patterns for this sort of thing? Thanks! A: What you want is not only a stack but also a stack of stacks (a stack of stacks?) The C++ equivalent of that is the `std::stack`. The FIFO/LIFO data structure on which `std::queue` relies is called a deque (double-ended queue). The deque from STL is a class template named `std::deque`. I would use an `std::vector`. I like to use the standard containers because it's easy to code against them. Trying to figure out a storyline for an upcoming story. Basically, you live in a small town (Minnetonka). There is a gang called "the Truckers". The Truckers are much older than you are (or at least they look older), 82157476af
